

Migrate

Migrate from self-managed MongoDB to MongoDB Atlas with confidence.

MongoDB Professional Services

Develop a prescriptive plan to migrate to MongoDB Atlas. Our team analyzes your goals and existing environment to outline the steps, tools and risk mitigation tasks to help you seamlessly migrate while minimizing impact to your business.

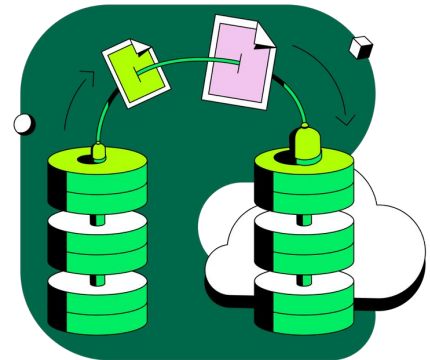

Overview

Migrating from self-managed MongoDB to MongoDB Atlas can open up significant opportunities to drive developer experience, launch new features with integrated data services, more easily support apps at planet-level scale, and reduce operational overhead and TCO.

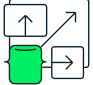

Database migrations are like moving from one house to another: they take planning and the right tools to do correctly, quickly, and without disrupting your entire business.

With a **Migrate** engagement, our Professional Services team will build a migration plan tailored to your migration scenario, considering technical requirements and constraints. Then, our team will execute that plan for you, partnering with your team through dry-run tests, production cutover, and post-migration validation.

After this engagement, your workload will be successfully deployed on MongoDB Atlas, with best practices followed every step of the way.

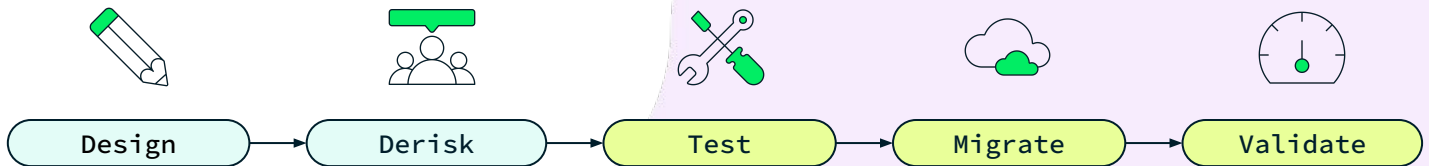

Migration Considerations

-  Business and security impact
-  Data size and cluster health
-  Scaling and architecture modernization
-  Current versions + upgrades
-  Existing automation and testing tooling

Migrate Engagements and Key Activities

MongoDB Professional Services guides you through our prescriptive, end-to-end Atlas Migration Methodology. With Essentials, our team understands your migration needs and builds a robust plan. Then, we partner with you through testing, production migration, and post-migration validation.

Essentials	Alignment and planning	Align on goals, and identify technical requirements and constraints through time-bound discovery and project planning workshops
	Discovery and inspection	Comprehensive analysis of your MongoDB environment, including application architecture, cluster configuration, relevant integrations, and telemetry data to conduct a Migration Readiness Assessment (MRA).
	Analysis and feedback	Key findings are compiled into a comprehensive “Migration Plan”, including migration steps, identified risks and mitigations, and tooling recommendations.
Implementation	Implementation	MongoDB executes a dry run of your Migration Plan to refine the plan. Our team then partners with you on the production migration.
	Post-Migration Review	After the migration, our team compiles work done in a review session and a Migration Cutover and Validation Playbook.
Typical engagement duration: 10 weeks
