TrueTracker™

Active Implement Steering System

Auto-guidance keeps your tractor on line, often eliminating skips and overlaps, but that doesn't mean the implement doing the work behind the tractor is perfectly aligned. Terraces, side slopes and generally rough terrain can all cause even small implements to drift. And drift means lost precision, inefficient work and potential damage to valuable crops. That's where TrueTracker comes in.

TrueTracker is our next generation active implement steering system that keeps your hitch-mounted or drawn implements on the same repeatable guidance line as your tractor. Powered by Autopilot™ technology with 3-axis terrain compensation and its own GNSS receiver, TrueTracker delivers unmatched accuracy, for every field and every guidance line.

Now controlled by the Precision-IQ™ operating system via powerful GFX displays and the NAV-960™ guidance controller, TrueTracker can access every major GNSS constellation, maintain high uptime and accuracy with Trimble® IonoGuard™ technology, and benefit from greatly improved positioning and line-following performance for maximum precision where it matters most.

Whether your implement has built-in steering or uses an aftermarket solution, TrueTracker extends the precision of your steering system all the way to your implement, so every row and every pass is dialed in, season after season.

TrueTracker

Active Implement Steering System

Key Features

- **Centimeter-level accuracy**—for both tractor and implement, across every terrain.
- **One display, one system**—no clutter, no confusion. Manage everything from your GFX display paired with our industry leading NAV-960 guidance controllers.
- **Independent calibration**—fine-tune your implement separately from your tractor with trim adjustments for total control.
- **Reverse-ready**—ideal for large implements like potato planters and harvesters that require accurate placement in forward and reverse.
- **Every guidance pattern**—straight, curved, or FreeForm lines are handled with ease on hillsides and rough ground, minimizing guess rows.
- **Dual steering control**—your implement steers like a second vehicle, correcting independently for true repeatability.
