MyRemodulin.com

A PERSONALIZED WEBSITE EXPERIENCE FOR
EACH INDIVIDUAL PATIENT'S NEEDS:
THEIR ROUTE. THEIR PUMP. THEIR JOURNEY.

MyRemodulin.com is a user-friendly website carefully created to offer your patients educational information specific to **their route of administration, pump, and therapy.**

Customized to Help Build Confidence

Living on pump based therapy can be challenging for patients at any point in their treatment journey. As their healthcare provider, you are often tasked with supporting their wide-range of educational needs.

United Therapeutics is proud to offer **MyRemodulin.com**, a personalized website to help meet the individual needs of each patient.

MyRemodulin.com leverages patient input to customize content to their treatment plan. This tailored approach is brought to life through engaging, easy to digest methods to increase understanding.

MYREMODULIN.COM IN 3 SIMPLE STEPS: REGISTER. EXPLORE. SHARE.

Personal and Pertinent

Patients have access to important information and helpful videos on their specific route of administration.

Resource-Full and Ready

MyRemodulin.com provides easy, instant access to pump user guides and informative how-to videos specific to your patient's pump, enabling patients to build their confidence.

Strategies for Side Effects

With helpful tips and tricks and educational resources, patients can access help for managing side effects specific to Remodulin and their route of administration.

Wholistic Support

MyRemodulin.com provides a central location to hear testimonials, connect with other patients, and access financial assistance and other support.

Pass It On

The included cards contain the information your patients need to get started with **MyRemodulin.com**. Share a card with a new or existing Remodulin patient and connect them to a world of educational information.

Remodulin® (treprostinil) Injection

Indication

Remodulin is a prostacyclin vasodilator indicated for the treatment of pulmonary arterial hypertension (PAH; WHO Group 1) to diminish symptoms associated with exercise. Studies establishing effectiveness included patients with NYHA Functional Class II-IV symptoms and etiologies of idiopathic or heritable PAH (58%), PAH associated with congenital systemic-to-pulmonary shunts (23%), or PAH associated with connective tissue diseases (17%).

In patients with PAH requiring transition from epoprostenol, Remodulin is indicated to diminish the rate of clinical deterioration. Consider the risks and benefits of each drug prior to transition.

Important Safety Information for Remodulin

Warnings and Precautions

- Chronic intravenous (IV) infusions of Remodulin delivered using an external infusion pump with an indwelling central venous catheter are associated with the risk of blood stream infections (BSIs) and sepsis, which may be fatal. Therefore, continuous subcutaneous (SC) infusion is the preferred mode of administration.
- Avoid abrupt withdrawal or sudden large reductions in dosage of Remodulin, which may result in worsening of PAH symptoms.
- Titrate slowly in patients with hepatic or renal insufficiency, because such patients will likely be exposed to greater systemic concentrations relative to patients with normal hepatic or renal function.
- Remodulin is a pulmonary and systemic vasodilator. In patients with low systemic arterial pressure, treatment with Remodulin may produce symptomatic hypotension.
- Remodulin inhibits platelet aggregation and increases the risk of bleeding.

Adverse Reactions

In clinical studies of SC Remodulin infusion, the most common adverse events reported were infusion site pain and infusion site reaction (redness, swelling, and rash). These symptoms were sometimes severe and sometimes required treatment with narcotics or discontinuation of Remodulin. The IV infusion of Remodulin with an external infusion pump has been associated with a risk of blood stream infections, arm swelling, paresthesias, hematoma, and pain. Other common adverse events ($\geq 3\%$ more than placebo) seen with either SC or IV Remodulin were headache (27% vs. 23%), diarrhea (25% vs. 16%), nausea (22% vs. 18%), rash (14% vs. 11%), jaw pain (13% vs. 5%), vasodilatation (11% vs. 5%), edema [9% vs. 3%), and hypotension (4% vs. 2%).

Drug Interactions

- Remodulin dosage adjustment may be necessary if inhibitors or inducers of CYP2C8 are added or withdrawn.

Specific Populations

- In patients with mild or moderate hepatic insufficiency, decrease the initial dose of Remodulin to 0.625 ng/kg/min of ideal body weight, and monitor closely. Remodulin has not been studied in patients with severe hepatic insufficiency.
- Safety and effectiveness of Remodulin in pediatric patients have not been established.
- It is unknown if geriatric patients respond differently than younger patients. Caution should be used when selecting a dose for geriatric patients.

There are no adequate and well-controlled studies with Remodulin in pregnant women. It is not known whether treprostinil is excreted in human milk or if it affects the breastfed infant or milk production.
