

Case Study

Fast Order Fulfillment

Automated batch picking

Customer and task

Replacedirect's mission is to prolong the life of electronic devices by offering a wide range of spare parts. Online sales account for 98% of their business with approximately 100 employees serving 23 countries.

They had outgrown their premises and were challenged to complete multiple orders with tight delivery demands. They required higher performance and better accuracy in a smaller footprint.

Replacedirect needed to integrate incoming goods, outgoing goods, and repairs into one process, while simultaneously adapting new logistics processes to the existing building's layout.

Solution

The team chose four Vertical Lift Modules Shuttle XP followed by three Horizontal Carousels with a closed-loop conveyor system. Together they hold 100,000 various-sized articles (the Horizontal Carousels offer 950 m² storage in a 170 m² space and the Shuttle XPs offer 530 m² storage in a 40 m² space).

Screens indicate incoming and outgoing operations in different colors. Supplies ready for storage are electronically recorded at packing stations, and then automatically directed to the picking stations by conveyors.

Once picked, outgoing orders or repairs travel automatically via conveyors to either dispatch or repair.

The pick- and put-to-light systems combined with batch picking make it possible to accurately pick, and replenish for retail, wholesale, and repairs simultaneously. Replacedirect now delivers 2,000 orders/day.

Case at a glance

How we took our customer from task to solution

The Dutch company, Replacedirect, is a major player in the after-sales market for electronic equipment. To keep up with an ever-growing customer base, Kardex customized a logistics solution to handle picking and replenishing simultaneously. This ensures Replacedirect processes orders and carries out repairs quickly and reliably.
