123 St Georges Terrace, Perth

People with Mobility Impairment

The lift control panel has a special international symbol of access button which is raised for easy use.

When the access button is pressed the following functions are activated:

- Additional time provided to move from the PORT ('Personal Occupant Requirement Terminal) to the allocated lift.

- The designated plate for the allocated lift illuminates and activates voice guidance that states lift x, lift x: gong, gong: lift x, lift x: doors opening: doors closing.

- The PORT System will identify the most suitable lift in the normal way but factors in the requirement for additional space in the lift for a wheelchair, carer or walking aid so the lift is not overcrowded.

People with Vision Impairment

Schindler's PORT system includes the provision of personalised assistance functions for passengers with access cards.

For a visually impaired passenger, their access card can be programmed to provide any or all of the following functions:

- Activate voice assistance and guidance at the PORT terminal.

- Automatically place calls to preprogrammed 'Home Floors' by presenting the access card to the card reader located on the PORT terminal and audibly allocate a lift.

- If the access card is held against the PORT reader the PORT terminal will announce the passengers other allowed floors sequentially.

- When the required floor is announced the passenger can simply remove their access card and the PORT system will register their call and audibly allocating a lift.

- The PORT system can be preprogrammed to allocate a specific lift from any PORT terminal so that they can easily navigate to the allocated lift.

- Allow additional time to move from the PORT terminal to the allocated lift.

- Activate the Designation plate indication and audible guidance.

- Door closing speed is reduced.
