

Single Webpage Structure for Sedation-Free TNE

HEADER

- **Hero Image or Video:** Feature a professional, reassuring image or a short video explaining the procedure, with an engaging headline such as “Sedation-Free TNE.”

ABOUT SEDATION-FREE TNE

- **Introduction:** “Sedation-Free Transnasal endoscopy (TNE) is a minimally invasive medical procedure performed by a physician intended to examine the digestive tract. It involves inserting an endoscope through the nose, advancing down through the esophagus (food pipe), stomach, and part of the small intestine (duodenum) to look at and treat conditions of the upper digestive tract.
- **Why Sedation-Free TNE?** It eliminates the risks associated with general anesthesia and reduces overall exposure to anesthetic agents for you or your loved one. Moreover, it cuts down on pre- and post-procedure time, resulting in shorter office visits and a quicker return to regular activities. Lastly, its single-use disposable design significantly reduces the risk of cross-contamination, which can occur with reusable equipment commonly employed in endoscopic examinations.

Overall, it’s a safer and more convenient alternative for diagnostic endoscopic exams of the upper GI tract!

SEDATION-FREE BENEFITS

- **“Sedation-Free, no more going to sleep!”:** This procedure is done while awake, eliminating the complications and inconveniences associated with general anesthesia.
- **“Needle-Free and Minimal Fasting Required”:** Enjoy a simpler preparation with no need for IVs and only brief fasting before the procedure.
- **“Enhanced Safety with Single-Use Scopes”:** Benefit from our use of sterile, single-use scopes that significantly reduce the risk of cross-contamination.
- **“Efficient and Convenient”:** Spend less time preparing for and recovering from your procedure, allowing you to quickly return to work, school, or other daily activities.

HOW IT WORKS OR WHAT TO EXPECT

- A numbing agent will be applied to your nasal passages to make you more comfortable.
- Once ready, the doctor will gently insert the scope through your nose. It will travel down through the esophagus (food pipe), stomach, and part of the small intestine (duodenum).
- If needed, very small tissue samples called biopsies may be taken through the scope using special forceps. Air and water may also be used to make it easier for the doctor to see.

PATIENT TESTIMONIALS (EXAMPLES)

Hear from our patients who have experienced the benefits of Sedation-Free TNE firsthand.

Example 1

“Having had traditional endoscopies before, I was amazed at how much less discomfort I experienced with Sedation-Free TNE. It was quick, and I was back to my normal routine in no time.”

Example 2

“I was a bit nervous about getting an endoscopy without sedation, but I was amazed by how smooth and comfortable the whole process was. The numbing agent made sure I felt no discomfort, and the procedure was over before I knew it. Being able to walk out of the clinic on my own and head straight back to school was incredible. I couldn’t believe I could feel myself again so quickly!”
