### VOC Content of Aeroseal Duct Sealant

Aeroseal has calculated the VOC content of the sealant material in terms of grams of VOC per liter of dried sealant material. This was done using our known VOC fraction by weight of 0.35%. This is based upon the liquid sealant, which is 65% water. For one liter of liquid sealant (weighing 1070 grams) this translates to 3.75 grams of VOC. As there are only 0.35 liters of solid sealant in that liter of sealant, the requested value is **10.7 grams of VOC per liter of dried sealant (3.75/0.35)**.
