# I currently do my consolidations in a spreadsheet. When should I invest in a consolidation solution?

The purpose of this article is to empower you to evaluate your current situation and make a fully informed decision on consolidations software.

Our first recommendation is related to your strategic vision. You don't know what might happen to your group tomorrow: a doubling of the scope due to the acquisition of a sub-group, a public offering with new shareholders who will demand a fast close, a change in consolidation rules, or much more precise information at consolidation level.

This can happen at any time, and given this, it's important to use suitable management tools to deal with new, unexpected, and demanding situations.

From a management standpoint, consolidations done with a spreadsheet will take more time than using a consolidations solution. The acquired time savings can then be allocated to the creation of reports or analyses that provide a greater added value for the group in question.

Let's take a look at the risks and difficulties you may encounter in your current situation.

# When Should you Invest in a Dedicated Solution?

## When should you invest in a dedicated solution?

Here are a few aspects to consider:

### 1. Consolidation Rules

First of all, it is helpful to remember the rules of consolidation - the consolidation process is based on accounting logic. It must contain reports for balances, journals, general ledger, etc., which are difficult to create in Excel. This causes a lot of frustration for auditors.

### 2. What is Consolidation?

Many “beginners” see consolidation information as being part of a matrix organization (companies x accounts) and, therefore, as excellent candidates for entry in a spreadsheet.

However, consolidation information is based on a transactional structure, not a positional one, which implies at least four different dimensions: the company, the account, adjustments, flows, and sometimes, analytical aspects. This information isn't part of a matrix, but of a hypercube, thus the need to use a database.

### 3. Consolidation Calculations with Spreadsheets

All calculations, operations, and transactions are done manually in a spreadsheet. Of course, some links and automated processes can be set up.

These links and automated processes can quickly turn into multiple worksheets, all linked together. Over the years, these worksheets become an illegible, inflexible, and risk-prone document. The flexibility of a spreadsheet, which is one of its strong points, becomes a risk in consolidation. Moreover, spreadsheets don't allow for consolidation package automation.

#### **Control and interest percentage calculations**

**Control and interest percentage calculations carried out before the consolidation process can quickly become laborious and the source of many errors, even for small groups, if they are done manually in a spreadsheet.**

There is a clear benefit to using a specialized solution. The solution will do all of the work for you and will also guarantee the reliability of the data: calculations, definition of the consolidation methods, implementation of various simulations within the scope, and the correction of any errors occurring in the latter.

### 4. Application of Consolidation Methods

The application of consolidation methods using spreadsheets is done manually, by definition, and is therefore very time consuming and can't guarantee reliable results. In fact, the conversion of corporate data into the consolidation currency and the calculations required for minority shareholders and consolidation reserves are fertile ground for errors. By automating all of these tasks, consolidation solutions enable productivity gains and make it possible to quickly obtain reliable results.

### 5. Minority Shareholders and Translation Adjustments

Many consolidations done using spreadsheets omit minority shareholders in the equity or proportionate approach. With this method, it's also common to forget to allocate minority shareholders their share in the value of a holding, held through another subsidiary, that isn't 100% owned by the parent company.

As for translation adjustments, consolidation reserves, and minority shareholders, their reconstitutions and justifications often result in an unbelievable loss of time because they must be reconstituted outside of accounting, starting with the corporate situation of each subsidiary.

If we go a little deeper into the consolidation process, we may still be faced with the problem of managing consolidation entries, the concept of flow, and the creation of restitution reports or financial statements, as well as of cash flow and tax proof tables.

## 6. Management of Consolidation Entries

A system for consolidation entries can be set up in Excel. However, ensuring its longevity is another matter. With each new consolidation period/year, it will be important to review the entries from the previous year to determine if they have to be carried over or not, and if yes, how?

In addition to the fact that this recurring exercise will be very time consuming, other items such as sales and deconsolidation must be taken into account. There is no doubt that Consolidators working with Excel will have to deal with the painful problem of isolating the entries by company.

The latter point requires working with linked accounts within each company, which is rarely the case in Excel. It provides the flexibility needed to post entries from company to company, but consequently compromises any possibility of obtaining contributions by company.

## 7. Updates

Using a spreadsheet to perform your consolidations also creates difficulties and risks when you need to update information. If the chart of accounts is deployed using one worksheet per company and it has to be modified, updates must be done for each worksheet, which is tedious. Not to mention the risk of using the wrong lines, resulting in inconsistent results.

## 8. Consolidation Variants

Again, a spreadsheet isn't the best tool for producing consolidation variants from the same set of data. For example, IFRS consolidation, followed by a version in local GAAP, creation of a sub-group, and production of segmented data (IFRS), etc.

## 9. The Concept of Flow

The concept of contribution isn't the only one that causes problems for Excel consolidations. In fact, most consolidations processed using a spreadsheet are done with balances. The notion of flow is usually absent. The implementation of a cash flow statement in Excel is always very laborious. It is created by trial and error, without any guarantee of quality and despite the time spent, by drawing on information in the financial statements of the various companies in the scope. In addition to cash flow, the concept of flow is essential to automating the creation of restitution reports and other required reports.

## 10. Intragroup (or Interco) Transactions

At some point in the consolidation process, the Consolidator must check the status of interco positions between subsidiaries one last time, even if a prior exchange procedure was carried out.

In practice, this means checking that the interco position of A with B for a certain account actually reflects interco position B with A for another account. This linking can take on combinatorial proportions that are difficult to manage in a spreadsheet.

Interco relationships are not relations from account to account but rather relations from accounts to accounts.

## 11. The Audit Phase

The auditors we have spoken with are clear: they are more confident when they have to audit a consolidation that was done with a consolidations solution. It's a guarantee of quality in their eyes. Consolidation solutions make all of the processes secure. In addition, the best performing consolidation solution provides detailed audit trails that enable auditors to access the reasons for each entry.

The result is a quick and efficient audit.

It's also very likely that the new European standards imposed on audit companies will lead them to recommend the use of dedicated professional tools to their clients in order to guarantee the quality of the consolidated accounts production process.

## 12. Sharing of Know-How

Lastly, spreadsheets are often only understood by the "creator of the model," but what happens if that person leaves the group? It becomes a matter of continuity and security.

If you need to produce reliable data quickly, save time, and gain credibility during the audit phase, we recommend that you invest in a consolidation solution. It's a matter of time savings and higher quality information for your internal and external clients.

# About Prophix®

Ambitious finance leaders engage with Prophix to drive progress and do their best work. Leveraging Prophix One™, a Financial Performance Platform, to improve the speed and accuracy of decision-making within a harmonized user experience, global finance teams are empowered to step into the next generation of finance with no reservation. Crush complexity, reduce uncertainty, and illuminate data with access to best-in-class automated insights and planning, budgeting, forecasting, reporting, and consolidation functionalities. Prophix is a private company, backed by Hg Capital, a leading investor in software and services businesses. More than 3,000 active customers across the globe rely on Prophix to achieve organizational success. Additional information at [www.prophix.com](http://www.prophix.com).
