The Difference Between IAB and Unique Downloads

IAB: is an acronym for the “Interactive Advertising Bureau” – an organization that has developed a series of industry standards to define what counts as a download.

The IAB-certified metric applies the following filters:

- Applying IP address blacklists – Removes downloads coming from IP addresses blacklisted for behavior not consistent with a website visitor or podcast listener (for example, a server caching content).
- Applying User Agent blacklists – Removes user agents that are known bots (computer programs that operate as an agent for a user or other program or to simulate a human activity).
- Ensures that at least one minute of playable content is downloaded.

UNIQUE: The Unique downloads algorithm accounts for two important pieces of information: IP Address and User Agent (Apple Podcasts, Chrome, etc.)
