Typical Hydraulic Strut Applications	10

#### **Description**

The Pacific Shoring Hydraulic Strut is a 3" aluminum hydraulic cylinder mounted on 12", 18" or 24" long heavy-duty waler rails. The assembly also has an optional angle bracket so that the strut can be set on a wale and position the cylinder at the wale web. Lift brackets are attached to the assembly for the purpose of setting the strut and providing vertical safety support so that the strut cannot fall into the excavation. The waler rail has hole positions that allow the cylinder to be centered on different depth steel wales such as HP14", HP12", W12" and W14" beams. Strutting should be centered on wale webs so as to prevent development of eccentric moments in addition to the axial forces that the strut delivers to the wale.

This Hydraulic Strut is generally used on waled excavation support systems, and directly on piles in pile and plate shoring systems. The Pacific Shoring Hydraulic Strut can be used in any situation where hydraulic force is needed provided it is safely secured from kick-out. In all situations, a competent person should determine that the strut is properly set and fixed into position.

### General Information for use of Pacific Shoring 3" Hydraulic Strut

1. The Pacific Shoring Hydraulic Strut tabulated here is based on requirements of Federal OSHA 29CFR, Part 1926, Subpart P-Excavations and Trenches

**1926.652(c)(2)-**Option (2) - Designs Using Manufacturer's Tabulated Data. 1926.652(c)(2)(i) -Design of support systems, shield systems, or other protective systems that are drawn from manufacturer's tabulated data shall be in accordance with all specifications, recommendations, and limitations issued or made by the manufacturer.

All provisions of Subpart P apply when utilizing this tabulated data. The contractor's competent person shall use this data to select allowable loading, allowable trench width and strut configuration. The competent person utilizing this tabulated data shall be experienced and knowledgeable of all requirements of Subpart P, and trained in the use and safety procedures for shoring applications.

2. Strut loading shall be determined by an engineer using acceptable excavation support design principals or a competent person that has determined the soil type and condition in accordance with

3

OSHA Appendix A, Soil Classification. Classification shall be just prior to installing the strut. Soil conditions may change at a later date and require revaluation of the strength and allowable depth.

- 3. After strut loads are determined, the engineer or competent person shall decide how to install the hydraulic shore so that the tabulated loads and trench widths for the strut are not exceeded.
- 4. The depth and spacing given in **Table 1, Table 2, Table 4, Table 6, and Table 7** governs the use of Pacific Shoring Hydraulic Struts and not tabulations given by other manufacturers. This Tabulated data applies exclusively to Hydraulic Struts manufactured by Pacific Shoring LLC. Any alterations to the Hydraulic Struts or variance from this tabulated data shall be indicated in a site-specific plan prepared and approved by a registered engineer.
- 5. When used in excavations the faces of excavations shall be vertical so that the shoring piles and wales are vertical and horizontal to the strut.
- 6. Pacific Shoring Hydraulic Struts may be used in any situation where axial load strutting is needed. The strut shall be securely attached with the bearing surface of the strut in the same plane as the bearing surface it is being attached to.
- 7. The strut shall always be secured so that it cannot fall down vertically due to gravity forces. In addition to the angle bracket hanger, a secondary tie off cable or chain shall be used to prevent it from falling on workers below.

#### **Classification of Soil Types**

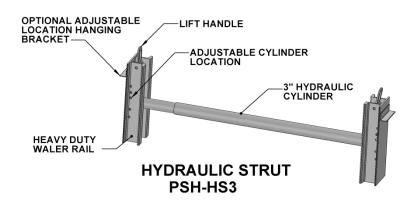

- 1. Soil classification shall be in accordance with OSHA Appendix A and classified just prior to installing hydraulic shores. Soil conditions may change at a later date and require hydraulic vertical shores to be reset at a different spacing.
- 2. The equivalent weight of OSHA soil types\* is assumed to be as follows:

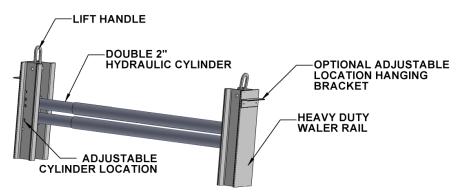

•	OSHA Type "A" Soil	25 PSF per ft of depth
•	OSHA Type "B" Soil	45 PSF per ft of depth
•	Type "C-60" Soil	60 PSF per ft of depth**
•	OSHA Type "C" Soil	80 PSF per ft of depth

<sup>\*</sup> These equivalent weights were adapted from OSHA 1926 Subpart P App C, Timber Shoring for Trenches, Tables C-1.1, C-1.2, and C-1.3

<sup>\*\*</sup> Type C-60 soil is not identified or classified in OSHA Appendix A3. Type C-60 soil is soil that does not qualify as OSHA Type A, or Type B, can be cut with vertical walls and will stand up long enough to safely insert and pressurize the hydraulic shore.

#### **Hydraulic Strut Allowable Loading**

#### HYDRAULIC STRUT PSH-HS2

	Table 1: Allowable Loads for Hydraulic Strut								
Model Allowable Load (lbs)									
	3" Cyl	inder							
	Oversleeve		Extension	Range (ft)					
PSH-HS-3	Oversieeve	12	15	18	20				
	4" Round x 3/16" Aluminum Oversleeve	40,000	20,000	12,000	10,000				
	4" Square x 3/16" Steel Oversleeve	40,000	40,000	30,000	18,000				
	Allowable Load (lbs)								
	2" Cylinder								
PSH-HS-2	Oversleeve	Extension Range (ft)							
P3H-H3-Z	Oversieeve	8	12	15	18				
	3" Round x 3/16" Aluminum Oversleeve	40,000	24,000	12,000	8,000				
	3" Square x 3/16" Steel Oversleeve	40,000	40,000	21,000	12,000				
Rails	18" or 24" Heavy Duty Waler Rail								

**Notes:** 1. Interpolation between cells in this table is allowed.

2. For 3 inch cylinders, loads listed are per cylinder. For 2 inch cylinders, loads are per double cylinder pack.

#### **Vertical Hydraulic Shore Selection Guide (PSH-HS3)**

Table 2: 3" Vertical Hydraulic Shore Selection Guide								
		Hydraulio	Cylinder I	Requireme	nts			
Depth of	Maximum	Maximum	Cylinder C	)versleeve	Required	per Width	Sheeting

OS2: 4" Sq	uare x 3/16" S	Steel Oversle	eve					

#### **Notes**

- 1. Soil shall first be classified in accordance with OSHA Appendix A Soil Classification for use with this selection guide. Type C-60 soil is OSHA Appendix A Type C soil that will stand up long enough to install the hydraulic shores.
- 2. Sheeting is required at any depth whenever sloughing or raveling occur. If sloughing or raveling occurs between sheeting, decrease spacing until it is prevented. See **Table 3** for allowable sheeting. Sheeting may be attached to jack or set into trench separately.

Up to 10'	8	8	8	12	PL 1"			
10' to 20'	6	6	8	12	PL 1"			

#### **Notes**

- a) Utilize PSH-HS2 or two independent 2 inch diameter hydraulic cylinders.
- b) Sheeting shall consist of 1" steel plate, ASTM A36, minimum Fy = 36 ksi.
- c) Sheeting is required in all applications using this tabulated data.
- d) Set sheeting and install jacks prior to workers entering the trench.
- e) Soil can stand with unsupported sidewalls long enough for shoring to be installed.
- f) This data is adequate for normal surcharge loads such as HS-20-44 traffic, 3 cy loader, excavator setback 2 ft from the edge of the trench.
- g) For trenches 8 ft to 12 ft wide use HSS3x3x3/16 steel tube oversleeves.
- h) For trenches 0 ft to 8 ft wide use 3" round x 3/16 thick aluminum oversleeves.
- i) Workers shall work in shored areas between jacks only. In trenches over 10 ft deep and 10 ft long there shall be a minimum of two sets of plate shoring.

10' to 20'	6	6	12	15	PL 1"			

#### **Notes**

- a) Utilize PSH-HS3 hydraulic cylinders.
- b) Sheeting shall consist of 1" steel plate, ASTM A36, minimum Fy = 36 ksi.
- c) Sheeting is required in all applications using this tabulated data.
- d) Set sheeting and install jacks prior to workers entering the trench.
- e) Soil can stand with unsupported sidewalls long enough for shoring to be installed.
- f) This data is adequate for normal surcharge loads such as HS-20-44 traffic, 3 cy loader, excavator setback 2 ft from the edge of the trench.
- g) For trenches 12 ft to 15 ft wide use HSS4x4x3/16 steel tube oversleeves.
- h) For trenches 0 ft to 12 ft wide use 4" round x 3/16 thick aluminum oversleeves.
- i) Workers shall work in shored areas between jacks only. In trenches over 10 ft deep and 10 ft long there shall be a minimum of two sets of plate shoring.
