

Retirement Roulette: Don't gamble your savings with bad timing

When you don't have a guarantee, timing is everything

The timing of returns may be more crucial in the years just before and after retirement. Negative returns early in retirement, especially with regular withdrawals, can drain savings faster, leaving you potentially without or with less retirement income.

Consider two retirees with the same investment portfolios in the example below. Each begins with an initial \$500,000 investment and 25-year period but face different markets when they begin taking retirement income when they need it most.

To retire confidently, investors need to be prepared for changing market cycles.

What is an annuity

An annuity, is a contract between you and an insurance company that is designed to help you meet your long-term retirement needs. An annuity can help you:

- Grow your money faster with the power of tax deferral.
- Diversify your investment strategy with a range of investment options.
- Save today and know you'll have guaranteed income in the future.

The results shown are intended to demonstrate the impact of the effect of market performance on retirement assets, assuming 5% annual withdrawals of \$25,000 (based on premium). Results are for illustrative purposes only and do not represent any particular investment or the deduction of any fees and charges. If fees and charges had been included, investment results would have been lower. Past performance does not guarantee future results.

Delaware Life

In certain market scenarios, such as a rising equity market when volatility is high or increasing, reductions in positive performance of a volatility controlled Index could result in less interest being credited to an Index Account than if the volatility controlled Index did not use a volatility control strategy that can limit positive performance. Conversely, in a declining equity market, when volatility is high or increasing, reductions in negative performance of the volatility controlled Index could result in more interest being credited to an Index Account than if the volatility controlled Index did not use a volatility control strategy. However, in such a declining market, the benefit from the volatility control strategy would be limited by the floor to the Contract. In general, we incur less expense for the hedging transactions we use to mitigate our risk in providing Contract guarantees to you for a volatility controlled Index than for other Indices in the Contract.
