

SYSTEM OF NARCOTICS IDENTIFICATION

INSTRUCTIONS FOR USE

TEST W

FOR: Amphetamines and Methadone, PMA and Ketamine

Test Function

- 1. Test W is a single ampoule test.
- 2. This reagent system presumptively identifies Amphetamines, Methadone, PMA and Ketamine.
- 3. This reagent is also useful as a screening test for many other drugs (refer to Polytesting System).

How to Use Test W

- Remove clip and insert into the test pouch an amount of powdered suspect material that would fit inside this circle.
 Reseal with clip and tap gently to assure material falls to bottom of pouch.
- 2. With the printed side of the test pouch facing you, break ampoule by squeezing the center of the ampoule with the tips of thumb and forefinger. Agitate gently and observe color or color changes.

Interpretation of Resulting Colors

- 1. A rapidly developing blue color indicates the presence of Methadone.
- 2. An immediate olive green color indicates the presence of Amphetamines.
- 3. This test can also be used to identify certain "Club Drugs". Refer to the Polytesting System.

CAUTION

- A. Since these tests contain strong acid, it is suggested that Test F Acid Neutralizer be used after testing and before disposal.
- B. Before discarding used test packs, remove clip and add one measure of acid neutralizer from Test F.
- C. Add slowly to prevent bubbling over.
- D. Do not reseal the test pouch until effervescence has stopped completely.
- E. Reseal the test pouch with clip and discard in a tamper-free disposal unit.
- F. No attempt should be made to crush glass particles after ampoules are broken.
- G. Antidote: In case of contact, immediately flush eyes or skin with water for at least 15 minutes while removing contaminated clothing and shoes. Call a physician. If swallowed, do not give emetics. Contact a physician.

WARNING

These tests are NOT designed for use with liquid samples.
