

# Managing Urine Odors on Artificial Grass

Handle your pet's "elimination routine" as you would on any other surface by REMOVING SOLIDS and treating areas where urine has been deposited.

DO NOT USE WATER TO SIMPLY RINSE AWAY SOLIDS – this will carry the debris across more surface area. Pick UP the solids, and TREAT the areas where urination is most probable, to sanitize and deodorize the artificial grass surfaces.

The artificial grass surfaces can handle your K9s daily business, it's the accumulation of materials, left behind, that can make the surfaces unpleasant – just like dirt, cement, wood and other materials can become tainted, so too will the artificial grass surfaces.

For the best performance – keep solids picked up and treat areas where your animal urinates, regularly, from the very start.

Many enzyme urine and odor removing carpet cleaning products are liquid and can be easily applied using a sprayer or pump nozzle. A few products are available as dry crystals that you mix into warm water and then apply. Either type of product, as a liquid, is best applied using a pressure spray bottle (available in most garden departments) – approximately 1 gallon per 500 square feet (SF).
