Ship Ladders: A Space-Saving Access Solution

What are Ship Ladders?

Ship ladders, also called ship stairs, are defined according to OSHA 1910.21 as steep stairways with treads and handrails, designed for slopes between 50 and 70 degrees. The term does not include all stairs on ships but unlike standard stairs, they are ideal for tight spaces where traditional stair runs aren't practical.

Where are They Used?

Ship ladders are perfect for industrial and commercial applications, such as maintenance access or storage areas. They are not intended for public, office, or residential spaces but offer a compliant, efficient solution for confined areas.

Features

- Aluminum Ship Steps
- 24" Tread width
- 4" Tread Depth
- Aluminum powder coated handrails
