

### IMPORTANT - READ ALL INSTRUCTIONS BEFORE YOU BEGIN

Some parts have sharp edges. Care must be taken when handling the various components to avoid personal injury. Wear gloves when handling.

1. If you are installing your grill in a cart, please consult the instruction manual that came with your cart. If you are installing your grill in an enclosure (see image below), you should locate the electrical box on the inside rear wall below the grill, or in a convenient location to access the box for service, or to replace a fuse. Leave some slack in the cables between the grill and box so as not to stretch the wires and make disconnection easier for service.
2. The electrical box has 2 mounting holes on either side to attach to a wall or other structure (mounting hardware not included). The box should be approx. 8" above the ground to avoid water intrusion under your island. See the INSTALLATION section of the Use & Care Manual that came with your grill.
3. Once mounted, connect the white connectors from your grill to the appropriate receptacles on top of the electrical box. The grill is designed for 120 volt AC power and must be plugged into a Ground Fault Circuit Interrupter (GFCI) protected circuit. Do not connect the grill to the electrical supply until after gas connections have been made and leak checks have been performed.

**KEEP ANY ELECTRICAL CORD AND FUEL SUPPLY HOSE AWAY FROM ANY HEATED SURFACES.**
