Outdoor porcelain pavers can be installed in several ways, including adhesive on concrete, on sand, and on grass. Adhesive installation on concrete is the most common and creates a permanent bond. Sand installation allows for easier drainage and is often used in landscaping. Grass installation is the simplest option and can create a natural, seamless look for a garden or lawn. Each installation option has its own advantages depending on the specific project and personal preferences.

## Laying Suggestions, Cleaning & Maintenance

### 1. LAYING

Before starting the installation process, make sure the laying surface is well cured, flat and completely clean and that the material available is sufficient in quantity and has the right tone and size.

### 2 CHOICE OF ADHESIVE

The use of an appropriate adhesive is essential for a successful installation. For the installation of ceramic tiles, you should follow the laying instructions provided by leading adhesives manufacturers.

You should choose the most suitable adhesive on the basis of the following factors:

- laying surface
- type and size of tile
- use of tiled surface (floor/wall; indoor/outdoor)
- weather conditions at the time of laying
- waiting time before the ceramic surface can be used

<sup>•</sup> For large size tiles laid at a height of more than three meters, certain international regulations specify that tiles should be laid using a mixed system of adhesive and mechanical fixtures chosen in relation to the weight of the tile, height of the tiling and site conditions.

•• For tiles with a side measuring more than  $11\frac{3}{4}''$  laid at heights of more than three meters, certain international regulations specify the use of an additional mechanical anchor that ensures the retention of the tile in case of accidental detachment, to be chosen in relation to the weight of the tile, the height of the tiling and the site conditions.

### 3. LAYING THE TILES

Installation should be performed by qualified personnel using the proper tools. The laying of the material should be checked before the adhesive is dry so that any corrections can be made. In any case, Atlas Concorde does not recommend installation without joints or joints smaller than 2 mm.

When laying tiles with a side longer than  $23\frac{5}{8}''$  and in any case for commercial indoor environments or outdoors it is essential to spread the adhesive using double buttering, applying the adhesive in a linear method parallel to the short side both on the substrate and on the back of the tile, thus ensuring perfect adhesion between the tile and substrate. To minimize the unevenness of the tiles both on the floor and on the wall it is recommended to use "easy installation systems" with spacers and levelers.

Spread the adhesive using a suitably toothed spatula.

### 3A. LAYING RECTANGULAR FORMATS

For straight courses of rectangular formats, the maximum offset between tiles must not exceed 1/3 of the length of the adjacent side.

### 4. SQUARE OR PERPENDICULAR CUTS

To perform square or perpendicular cuts, it's best to first drill circular holes near the corners of the hole and then connect them with linear cuts, which will relax the tension at the corners of the tile.

### 5. JOINTS AND GROUTING

Before filling the joints, it is recommended to wait until the adhesive is completely dry and to ensure that the joints are free of all traces of adhesive and/or dust. In any case, Atlas Concorde does not recommend installation without joints or joints smaller than 2 mm. For joints in a color that contrasts with the tiles, it is recommended to test the grout in a small, hidden area. You should follow the instructions provided by leading grout manufacturers.

USE	RECOMMENDED GROUTS - EUROPEAN STANDARDS EN 13888
Residential interiors	Improved cementitious mortars for joints (Class CG2)
Damp interiors (bathrooms, showers) and outdoors	Improved cementitious mortars for joints with low water absorption (CG2 WA)
Commercial premises	Improved cementitious mortars for joints with high resistance to abrasion (Class CG2 A)
Premises requiring total hygiene and resistance to chemical agents (swimming pools, kitchen work surfaces, food industry, hospitals, supermarkets, etc).	Epoxy mortars (Class RG).

### 5A. ELIMINATION OF EXCESS GROUT

To correctly and easily eliminate excess grout, follow the instructions given by the grout manufacturer. In general, proceed as follows:

#### Cementitious grouts

When the grout becomes opaque (normally after 10-20 minutes), clean with a hard cellulose sponge using movements on a diagonal to the joints. It is important to respect

the drying time to avoid removing the grout from the joints.

#### Epoxy grouts

When the mixture is still fresh, wet the surface with plenty of water, emulsifying with a pad like Scotch-Brite®, paying attention not to empty the joints. The residual grout liquid can be removed with a hard cellulose sponge (to be replaced when excessively soaked with resin).

It is vital to remove epoxy grout rapidly before it starts hardening as it is extremely difficult to remove subsequently. If the epoxy grout has started to harden, try adding 10% alcohol to the washing water.

### 6. CLEANING AND MAINTENANCE

#### 6A. FINAL SITE CLEANING

The work site is considered finished when it is cleared of any tools/materials used for the job. To reduce the risk of damage to the tiled surface, it is necessary to protect it and avoid the presence of abrasive materials.

After a few days, eliminate residues with a commercial Scotch-Brite® pad, brush or single brush floor cleaner (for large surfaces).

For walls, use a neutral detergent in hot water.

For floors, use a mild acid wash diluted according to the type of surface (smooth or textured). It is important to protect marble or metal inserts previously with adhesive tape.

Rinse with abundant clean water to eliminate all marks or residues from the joints.

If necessary, repeat the acid wash at a higher concentration, unless there are marble or metal inserts. Do not use diluted commercially-available acids.

#### 6B. ROUTINE MAINTENANCE

You are recommended to use ordinary neutral detergent diluted in water.

Avoid using acid or alkaline products, waxes and/or impregnants and metal pads (iron or steel sponges).

In the event of heavy dirt or particularly textured surfaces, use an alkaline detergent and rinse after washing.

For large surfaces, the use of a floor washing machine is recommended.

#### 6C. UNSCHEDULED MAINTENANCE

In the event of dirt resistant to the ordinary cleaning, use a suitable detergent for the particular kind of dirt.

TYPE OF DIRT (resistant to ordinary maintenance)	DETERGENT/SOLVENT
Coal, lime efflorescence, chalk, metal marks, rust, graphite, emulsion paint	Acid detergents*
Coca cola, coffee, wine, beer, ice cream	Alkaline detergents
Resin, silicon or mechanical oils, candle wax, paint	Solvents
Tire marks, sole marks, suction cup marks	Alkaline detergent in an abrasive paste

\* Important: Acid products may corrode marble, granite, natural stone and metal. Avoid using in the presence of decoration or inserts in these materials

The cleaning characteristics of the materials may vary significantly depending on the laying method, conditions of use, type of surface and environment. Generally speaking, the higher the non-slip characteristics of the tiles, the more difficult they are to clean.

The maintenance and cleaning operative should always test each cleaning method empirically in advance (if possible on a piece of the material not laid)

In the case of particularly heavy use (for example, mechanical workshops or environments with a heavy presence of oily residues and tire marks), incorrect laying or inappropriate cleaning, Atlas Concorde declines all responsibility for the effectiveness of cleaning and maintenance operations. Atlas Concorde cannot, under any circumstances, be held responsible for events, damage or defects caused by incorrect laying, negligent cleaning and maintenance or the use of materials and adhesives inappropriate for the use.
