- Breast
- Colonoscopy and EGD
- Hernia
- Skin & Soft Tissue
- Spleen
- Stomach
- Thyroid

APPENDICITIS

Appendicitis is the inflammation of the appendix, a small finger-like projection that extends from the large intestine. Appendicitis is a medical emergency that requires surgery to remove the appendix.

CHOLECYSTITIS

Cholecystitis is the inflammation of the gallbladder, a small organ that stores bile, a digestive fluid. Cholecystitis can be caused by gallstones, which are hardened deposits of bile.

GALLSTONES

Hardened deposits of bile that can form in the gallbladder or bile ducts. Gallstones are formed when substances in the bile, like cholesterol, harden. Gallstones can be unnoticeable or asymptomatic. However, if these stones become stuck in a duct, you may experience what is called a gallbladder attack.

HERNIAS

A hernia occurs when an organ or tissue pushes through a weakness in the muscle wall. Hernias can occur in the groin, abdomen, or other parts of the body. They can be painful and cause discomfort, often preventing people from taking part in physical activities they love. Ignoring symptoms may lead to complications that can be life-threatening.
