FOR IMMEDIATE RELEASE

HALLIBURTON INTRODUCES STREAMSTAR™ WIRED DRILL PIPE INTERFACE SYSTEM

Continuous surface power and real-time data optimize closed-loop automation for superior well delivery

HOUSTON – Oct. 30, 2025 – Halliburton (NYSE: HAL) launched the [StreamStar™ wired drill pipe interface system](#), a breakthrough solution that delivers real-time, high-speed data and continuous downhole power. This system enables faster, more accurate decisions and improves orchestrated closed-loop automation.

"With the StreamStar system, Halliburton sets a new benchmark for drilling performance," said Jim Collins, vice president, Sperry Drilling, Halliburton. "It transforms the wired drill string into an intelligent network that improves drilling automation, geosteering, and well integrity for precise well placement and optimized completions."

The StreamStar system is the first of its kind to minimize the use of downhole generators and lithium batteries. This allows a shorter, more compact bottomhole assembly design that places sensors closer to the bit for improved measurements and reliability. It also provides instant, two-way communication between the logging-while-drilling system and the rotary steerable system. The result is faster, more accurate decisions that deliver reduced well construction time.

Halliburton embeds digital throughout the organization, from data acquisition and analysis to mobilization and automation of operations. The StreamStar system represents the latest addition to Halliburton's [iStar® intelligent drilling and logging platform](#). It integrates with the company's [LOGIX™ automation and remote operations family of solutions](#) to execute instant commands, maintain closed-loop control, and optimize drilling in real-time.

As drilling evolves toward smarter, automated operations, the StreamStar system delivers unmatched precision, efficiency, and confidence in every well.

Learn more about Halliburton [drilling technologies](#) and the StreamStar wired drill pipe interface system.
