Allow your users to seamlessly interact with third-party apps

With embedded apps, you can easily integrate your existing web applications into Webex meetings and spaces.

Your users collaborate with each other both in real-time, during Webex meetings, and on an ongoing basis, in Webex spaces. However, the information that they need to reference is often in other web-based applications, requiring them to switch contexts and their focus.

Elevate the meeting experience for your users, with embedded apps in meetings. Everyone can immediately see and interact, without having to download the embedded app.

With embedded apps in spaces, your users no longer have to toggle between windows, tabs, and other applications.

Ready to get started? We'll walk you through how to enable public apps or your own private embedded apps for your users.
